

COVID Vaccine Problems Are Adding Up

Recently, the officials in charge of the disaster that is our government's COVID-19 response implemented a program to add the COVID "vaccine" to the childhood vaccination schedule.

Next to having pregnant women injected, this is probably the most preposterous idea anyone has come up with.

It has been noted that during the absurd lockdown, when parents couldn't take their children for routine vaccinations, the childhood mortality rate fell 30 percent.¹⁶ This is not an accident of data mixing, as has been demonstrated by the study Dr. James Lyons-Weiler and I conducted using information from the largest pediatric practice in Oregon.¹⁷

It has also been shown that by the third injection of a COVID vaccine, a person's immunity is virtually destroyed. At that point, they basically have vaccine-induced acquired immunodeficiency syndrome (VAIDS).^{18, 19}

In addition, the online journal "The Expose" reported that there was a 52 times greater risk of vaccinated children developing COVID-19 than unvaccinated children,²⁰ as had been previously described in scientific literature.

That means those who have been injected will not only have a greater risk of recurrent COVID — as we have seen — but are also at greater risk for all other infections, including cancers.

Recently, oncologists around the world have noted a spike in colon and breast cancers among very young people, and leukemia cases are through the roof. Of course, this outcome is to be expected in the case of widespread immune suppression, as the immune system is the body's primary protector against cancer development.

But the COVID injections also cause other factors that stimulate new cancers and cancer recurrence, including DNA repair defects, altered cell apoptosis mechanisms, and metabolic changes.

These new malignancies have been referred to as

Reducing Heart Damage

Studies have shown that hesperidin is very useful for protecting the heart against the effects of prolonged high blood pressure, which if left untreated can cause the heart to enlarge and eventually fail. The compound also protects against atrial fibrillation, an arrhythmia in which the heart beats rapidly and with incredible irregularity. Atrial fibrillation is a major cause of death in people with heart disease.

By selectively increasing nitric oxide levels within the blood vessels supplying the heart, hesperidin can reduce the damaging effects of heart attacks and chronic heart disease. What this compound is doing is increasing blood flow to the heart muscle, especially the microcirculation supplied by the smallest blood vessels, called arterioles. This collateral blood supply can mean the difference between a fatal heart attack or severe heart damage, and survival with a good outcome. The increased blood flow also prevents scarring of the heart muscle.

"turbo cancers" because of their incredibly rapid growth; they too are being seen around the world. Usually, these cancers become incurable by the second or third week.

A recent study also found a 3.7-fold increase in cardiac death rate for people who took the Pfizer vaccine, compared to placebo.²¹

Other studies found that even those (mostly young people) who had mild cases of myocarditis — inflammation of the heart muscle — also demonstrated heart scarring on scans.²² These people could die at a very young age from cardiac causes.

More than 1,400 previously healthy young athletes have died since rollout of the injection. That represents an 82 percent increase over the period before the COVID injections.²³

We knew very early on that younger people, especially children, were not in danger from the COVID-19

Vitamins That Benefit Vision

Eating a mixture of nutrient-dense vegetables such as kale, greens, spinach, celery, parsley, Brussels sprouts, broccoli, cauliflower, cabbage, and garlic provides high-level antioxidant mixtures. Blending them works even better.

Vitamin C. A number of studies have shown that high vitamin C intake lowers intraocular pressure (IOP) in glaucoma and protects the retina. In one study, vitamin C lowered IOP within a few hours. When combined with natural vitamin E (mixed tocopherols and tocotrienols), vitamin C has its maximum protective effect. In addition, vitamin C is used by the body to produce hyaluronic acid, which is deficient in cases of glaucoma.

B vitamins. One of the major functions of B vitamins is energy production by cells. They have also been shown to counteract excitotoxicity — particularly vitamin B12 (methylcobalamin), folate, niacinamide, thiamine, and riboflavin, especially when used in combination. In one study of patients with glaucoma, researchers found that giving vitamin B12 stopped progression of vision loss during a five-year follow-up.

virus, and not likely to transmit the infection. Yet the government has continued a campaign to have these individuals “vaccinated,” usually by scaring parents or by instituting mandates.

Furthermore, we now know that the injections do not protect the recipient, nor stop transmission of the virus, which was the rationale for the mandates.

In many cases, it is a person’s personal doctor who recommended the injection because they were fooled by the medical establishment and the pharmaceutical industry into believing the vaccine worked.

We knew much of this before. For example, we knew that the flu vaccine affords no protection for children 4 years old or younger, and it only rarely protects people older than that.

We have also known for a long time that people who receive a flu vaccination are more likely to develop a serious lung infection for at least one year afterward.

The practice of combining vaccines has never been tested for safety. And there is strong scientific evidence that combining vaccines is hazardous for the brain, but this is ignored for greater profits and

most doctors aren’t even aware of that fact, just as they don’t know that you should never vaccinate a sick child.

And there is a new warning of great interest. Some years ago, the vaccine “experts” observed that many vaccines contain viral fragments. But then, inexplicably, they made the statement, “We don’t think this is of any safety concern.”

Don’t think it’s of any safety concern? It’s known that viral fragments that get into a person’s DNA can cause havoc. That’s a safety concern.

Recently, a molecular biologist from the Medical University of South Carolina examined the contents of many vials of COVID vaccines and found thousands of viral fragments in them.

These can get into a person’s DNA after injection and persist for a lifetime, producing all kinds of problems including cancer.

In fact, researchers found that the vaccines contained a known cancer-causing virus, SV40, as well as a substance that activates the SV40 virus should a person already have it dormant in his or her body.

The SV40 virus was a very common viral contaminant in the polio injections of an earlier era, and in many cases has remained dormant in people’s bodies. With multiple injections causing suppression of the immune system, SV40 viruses will become active and could cause cancer.

Other cancer-causing viruses are also latent in a large number of people, and could be activated by multiple COVID injections.²⁴ The virus could kill directly as well, and often does in people with suppressed immunity. ■
